## **We've been busy!**

At the Rainier Rubber Company we have been expanding our capabilities in order to insure that our leads times remain at four weeks. In order to accomplish that we have made a substantial investment in new equipment and expanded the utilities to our facility.

Four new presses are in the process of being floored along with our new state-of-the-art deflashing equipment. With these additions we are better able to continue our commitment to lean manufacturing principles, shortening the flow for your orders through our plant. Our investment has been substantial and is integral to our commitment to your business.

Our capital investment not only helps to maintain our shorter than industry average lead times. It also helps reduce the cost of doing business by reducing waste, labor and time.

### **Your success is our success!**

Ancillary equipment in our stock prep and trimming departments is also being investigated. All of these additions are aimed at reducing the manufacturing lead times associated with your orders. Future plans include expansion of our injection molding line and further additions to our compression and transfer molding line. As the needs arise Rainier Rubber Company is committed to continuing to meet the needs of our customers.

With the recent approvals to our quality document Rainier Rubber Company is now approved to or meets the requirements of D1-9000 Rev. A, ISO9002, AS9000 and Guide 25.
